

TRACEABILITY CAN ESTABLISH

- Origin URL, publisher and immutable captured bytes
- Capture, retrieval and cutoff times; SHA-256 and version
- Exact span, typed claim and verifier decision
- Named approval and the report/export version it binds

This supports auditability and repeatability.

TRACEABILITY CANNOT ESTABLISH SOURCE TRUTH

- An admitted or cited source may still be wrong
- Incompleteness, bias, filing lag and conflicts remain possible
- Attribution and passage support are not factual proof
- Verification records a bounded decision, not certainty

Uncertainty and limitations remain part of the report.
